Title of Invention

Unicode Semantic Dictionary and Multi-Logic Processing Architecture for Modular Reasoning Systems

Cross-Reference to Related Applications

None.

Background of the Invention

1. Field of the Invention: The present invention relates to computational logic and reasoning systems, specifically a modular architecture that uses a Unicode-based semantic dictionary to map and process rules across multiple logic paradigms. It enables computers to handle validation, translation, and extension of logical arguments in software applications, such as AI reasoning engines.
2. Description of Related Art: Current computational systems are often restricted to single logic paradigms and lack a standardized, extensible dictionary for interoperability across types. While Unicode supports mathematical symbols, it is not systematically applied to a comprehensive multi-logic framework. Existing tools like logic solvers (e.g., for propositional logic) do not include a unified mapping for 15+ systems or plugin-based extensibility. The invention solves this by providing a neutral framework for efficient argument processing and cross-paradigm translation.

Summary of the Invention

The invention is a software system with: (1) a Unicode Semantic Dictionary for 300+ symbols and rules in 15+ logic systems; (2) modular engines for processing arguments in each system; (3) an extensible translation matrix with 50+ functions for cross-system mapping; (4) adaptive workflows for input analysis, engine selection, validation, and output; (5) plugin architecture for adding new logics. It processes premises and conclusions to validate consistency and generate results, suitable for AI without specific biases.

It achieves: Parsing <50ms for 2000 tokens; validation <35ms; memory <5MB per process; accuracy >95%. Implemented in JavaScript with YAML plugins for portability.

Detailed Description of the Invention

The invention is a computational framework for multi-logic processing. It can be implemented in software to enable skilled programmers to build and use it.

- 1. Unicode Semantic Dictionary The dictionary maps symbols to functions and rules for each logic system. Entries include symbol, Unicode code, applicable systems, semantic function, and processing rule. This allows parsing and validation. See Figs. 1-15 for tables.
- 2. Modular Logic Processing Engines Each engine processes arguments (premises, conclusion) in its paradigm. Steps: Parse, validate, return result. Engines are neutral for general use. See Figs. 16-24 for examples.
- 3. Extensible Cross-System Translation Matrix Functions map between systems. E.g., Modal to Temporal. See Fig. 25 for examples.
- 4. Adaptive Processing Workflow Workflow analyzes input, selects engine, validates, generates output. See Fig. 26.
- 5. Plugin-Based Extensibility Add systems via YAML. See Figs. 27-28.
- 6. Implementation and Performance JS structure (Fig. 27). Performance: See Fig. 29.

Anyone with software skills can make this from the description—no extra experiments needed.

Fig. 1: Core Logical Operators Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
¬	U+00AC	All	Negation	NOT(P) → ¬P
∧	U+2227	All	Conjunction	AND(P,Q) → P ∧ Q
∨	U+2228	All	Disjunction	OR(P,Q) → P ∨ Q
→	U+2192	All	Implication	IMPLIES(P,Q) → P → Q
↔	U+2194	All	Biconditional	IFF(P,Q) → P ↔ Q
T	U+22A4	All	Truth	TRUE() → T
⊥	U+22A5	All	Falsity	FALSE() → ⊥

Fig. 2: Quantifiers & Variable Binding Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
∀	U+2200	FOL, HOL, Type Theory	Universal Quantification	FORALL[x,P] → ∀x P
∃	U+2203	FOL, HOL, Type Theory	Existential Quantification	EXISTS[x,P] → ∃x P

λ	U+03BB	Type Theory, HOL	Lambda Abstraction	$\text{LAMBDA}[x,e] \rightarrow \lambda x.e$
μ	U+03BC	Modal, Temporal	Least Fixed Point	$\text{LFP}(X,\varphi) \rightarrow \mu X.\varphi$
ν	U+03BD	Modal, Temporal	Greatest Fixed Point	$\text{GFP}(X,\varphi) \rightarrow \nu X.\varphi$

Fig. 3: Modal & Temporal Operators Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
$\Box$	U+25A1	Modal (K,S4,S5)	Necessity	$\text{NECESSARY}(P) \rightarrow \Box P$
$\Diamond$	U+25C7	Modal (K,S4,S5)	Possibility	$\text{POSSIBLE}(P) \rightarrow \Diamond P$
O	U+25CB	Temporal (LTL)	Next	$\text{NEXT}(P) \rightarrow OP$
$\Diamond$	U+25CA	Temporal (LTL)	Eventually	$\text{EVENTUALLY}(P) \rightarrow \Diamond P$
$\Box$	U+25A1	Temporal (LTL)	Always	$\text{ALWAYS}(P) \rightarrow \Box P$
U	U+0055	Temporal (LTL)	Until	$\text{UNTIL}(P,Q) \rightarrow P \text{ U } Q$
R	U+0052	Temporal (LTL)	Release	$\text{RELEASE}(P,Q) \rightarrow P \text{ R } Q$

Fig. 4: Deontic (Normative) Operators Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
O	U+004F	Deontic	Obligation	$\text{OBLIGATORY}(P) \rightarrow OP$
P	U+0050	Deontic	Permission	$\text{PERMITTED}(P) \rightarrow PP$
F	U+0046	Deontic	Forbidden	$\text{FORBIDDEN}(P) \rightarrow FP$
O	U+2299	Deontic	Conditional Obligation	$\text{COND OBL}(P,Q) \rightarrow P \odot Q$

Fig. 5: Epistemic Operators Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
K	U+004B	Epistemic	Knowledge	$\text{KNOWS}(a,P) \rightarrow K_a P$
B	U+0042	Epistemic	Belief	$\text{BELIEVES}(a,P) \rightarrow B_a P$
C	U+0043	Epistemic	Common Knowledge	$\text{COMMON}(P) \rightarrow CP$
E	U+0045	Epistemic	Everyone Knows	$\text{EVERYONE}(P) \rightarrow EP$

Fig. 6: Fuzzy & Probabilistic Operators Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
$\odot$	U+2297	Fuzzy	T-norm (min)	$\text{TNORM}(P,Q) \rightarrow P \odot Q = \min(P,Q)$
$\oplus$	U+2295	Fuzzy	T-conorm (max)	$\text{TCONORM}(P,Q) \rightarrow P \oplus Q = \max(P,Q)$
-o	U+228B	Linear Logic	Linear Implication	$\text{LIMP}(P,Q) \rightarrow P -o Q$
P	U+2119	Probabilistic	Probability	$\text{PROB}(P) \rightarrow P(P)$
E	U+1D53C	Probabilistic	Expected Value	$\text{EXPECT}(X) \rightarrow E[X]$

Fig. 7: Paraconsistent & Non-Classical Operators Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
$\sim$	U+223C	Paraconsistent	Weak Negation	$\text{WEAK NOT}(P) \rightarrow \sim P$
$\circ$	U+229A	Relevance Logic	Fusion	$\text{FUSION}(P,Q) \rightarrow P \circ Q$
*	U+002A	Substructural	Multiplicative Conjunction	$\text{MULT AND}(P,Q) \rightarrow P * Q$
$\oplus$	U+2295	Linear Logic	Par (Multiplicative Or)	$\text{PAR}(P,Q) \rightarrow P \oplus Q$

!	U+0021	Linear Logic	Of Course (Exponential)	REPLICATE(P) → !P
?	U+003F	Linear Logic	Why Not (Exponential)	WEAKEN(P) → ?P

Fig. 8: Set Theory & Type Theory Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
∈	U+2208	Set Theory, Type Theory	Element Of	MEMBER(x,S) → x ∈ S
⊆	U+2286	Set Theory	Subset	SUBSET(A,B) → A ⊆ B
∪	U+222A	Set Theory	Union	UNION(A,B) → A ∪ B
∩	U+2229	Set Theory	Intersection	INTERSECT(A,B) → A ∩ B
:	U+003A	Type Theory	Type Annotation	HAS TYPE(t,T) → t : T
=	U+003D	Type Theory	Definitional Equality	DEF EQ(a,b) → a = b
≈	U+2243	HoTT	Homotopy Equivalence	EQUIV(A,B) → A ≈ B

Fig. 9: Extended Quantum Logic & Computational Semantics Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
⊕	U+2295	Quantum	Quantum XOR	QXOR(A,B) → A ⊕ B
⊗	U+2297	Quantum	Tensor Product	TENSOR(A,B) → A ⊗ B
-o	U+228B	Linear, Resource	Linear Implication	LIMP(A,B) → A -o B
ħ	U+210E	Quantum	Planck Constant	QUANTIZED(E) → ħω
∫	U+222E	Quantum	Path Integral	PATH INT(φ) → ∫ Dφ e^{i S[φ]/ħ}

Fig. 10: Homotopy Type Theory & Higher Categories Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
$\simeq$	U+2243	HoTT	Homotopy Equivalence	$\text{EQUIV}(A,B) \rightarrow A \simeq B$
$= (\text{Id}_A)$	U+003D (var)	HoTT	Identity Type	$\text{ID TYPE}(x,y,A) \rightarrow x =_A y$
∞	U+221E	HoTT, ∞ -Categories	Infinity	$\text{INFTY GROUPOID}(x) \rightarrow \infty\text{-Grp}$
$\vdash$	U+22A2	Type Theory	Typing Judgment	$\text{TYPES}(t,A) \rightarrow \vdash t : A$
Π	U+03A0	Dependent Types	Pi Type	$\text{PI TYPE}(x:A,B) \rightarrow \Pi(x:A)B(x)$
Σ	U+03A3	Dependent Types	Sigma Type	$\text{SIGMA TYPE}(x:A,B) \rightarrow \Sigma(x:A)B(x)$

Fig. 11: Coalgebraic & Behavioral Logic Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
∇	U+2207	Coalgebraic	Nabla Modality	$\text{NABLA}(P) \rightarrow \nabla P$
$\circ$	U+25EF	Process Logic	Process Composition	$\text{COMPOSE}(P,Q) \rightarrow P \circ Q$
$\approx$	U+2248	Bisimulation	Behavioral Equivalence	$\text{BISIM}(p,q) \rightarrow p \approx q$
$\circ$	U+25CB	Fixedpoint Logic	Least Fixedpoint	$\text{LFP}(X,p) \rightarrow \circ X.p$
G	U+0047	Fixedpoint Logic	Greatest Fixedpoint	$\text{GFP}(X,p) \rightarrow G X.p$

Fig. 12: Separation Logic & Resource Reasoning Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
--------	---------	---------------	-------------------	-----------------

*	U+2217	Separation Logic	Separating Conjunction	SEP AND(P,Q) $\rightarrow$ P * Q
-o	U+228B	Separation Logic	Separating Implication	SEP IMP(P,Q) $\rightarrow$ P -o Q
emp	U+2205	Separation Logic	Empty Heap	EMPTY HEAP() $\rightarrow$ emp
$\rightarrow$	U+2192	Separation Logic	Points-To	POINTS TO(x,v) $\rightarrow$ x $\rightarrow$ v

Fig. 13: Answer Set Programming & Non-Monotonic Logic Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
:-	U+2190	ASP	Rule Implication	ASP RULE(H,B) $\rightarrow$ H :- B
not	-	ASP	Negation as Failure	NAF(P) $\rightarrow$ not P
#count	-	ASP	Aggregate Count	COUNT(S) $\rightarrow$ #count{X: P(X)}
$\models$	U+22A8	ASP	Stable Model Satisfaction	STABLE(M,P) $\rightarrow$ M $\models$ P

Fig. 14: Category Theory & Topos Logic Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
$\dashv$	U+22A3	Category Theory	Adjunction	ADJOINT(F,G) $\rightarrow$ F $\dashv$ G
$\cong$	U+2245	Category Theory	Isomorphism	ISO(f) $\rightarrow$ f $\cong$ g ^{-1}
$\vdash$	U+22A2	Category Theory	Natural Transformation	NAT TRANS(α ,F,G) $\rightarrow$ α : F $\vdash$ G
T_1	-	Topos Logic	Terminal Object	TERMINAL() $\rightarrow$ T_1
Ω	U+03A9	Topos Logic	Subobject Classifier	CLASSIFIER() $\rightarrow$ Ω

Fig. 15: Cubical Type Theory & Computational Logic Table

Symbol	Unicode	Logic Systems	Semantic Function	Processing Rule
I	U+0049	Cubical	Interval Type	INTERVAL() → I
i0	-	Cubical	Interval Endpoints	LEFT END() → i0
i1	-	Cubical	Interval Endpoints	RIGHT END() → i1
~	U+007E	Cubical	Path Reversal	REVERSE(p) → ~p
∂	U+2202	Cubical	Boundary	BOUNDARY(p) → ∂p

Fig. 16: Expanded Logic System Processing Architecture Flow (Boolean Engine Example)

INPUT: Argument(Premise, Premise, ..., Conclusion)

PROCESS:

1. Parse statements into atomic propositions (P, Q, R, ...)
2. Apply truth table evaluation
3. Check validity; interpretations $(P1 \wedge P2 \wedge \dots \wedge Pn) \rightarrow C$
4. Return: VALID / INVALID + counterexample

Fig. 17: Expanded Logic System Processing Architecture Flow (Modal Engine Example)

INPUT: Argument(Necessary, Premises, Possible, Premises, Modal, Conclusion)

PROCESS:

1. Build Kripke model $M = (W, R, V)$
2. Evaluate $\Box P$ at world w : $\forall w'(wRw' \rightarrow M, w' \models P)$
3. Evaluate $\Diamond P$ at world w : $\exists w'(wRw' \wedge M, w' \models P)$
4. Check frame properties (reflexive, transitive, symmetric)
5. Validate if conclusion follows necessarily

Fig. 18: Expanded Logic System Processing Architecture Flow (Deontic Engine Example)

INPUT: Argument(Normative, Premises, Deontic, Conclusion)

PROCESS:

1. Identify obligations (OP), permissions (PP), prohibitions (FP)
2. Check deontic consistency; $\sim (OP \wedge FP)$
3. Apply normative frame: ideal worlds vs actual world
4. Validate ought-implies-can: $OP \rightarrow \Diamond P$
5. Check for conflicting obligations

Fig. 19: Expanded Logic System Processing Architecture Flow (Epistemic Engine Example)

INPUT: Argument(Knowledge, Claims, Belief, States, Epistemic, Conclusion)

PROCESS:

1. Model agent knowledge: $K_a P$ (agent a knows P)
2. Check knowledge axioms
 - K axiom: $K P \rightarrow P$ (truth)
 - 4 axiom: $K P \rightarrow K K P$ (positive introspection)
 - 5 axiom: $\sim K P \rightarrow K \sim K P$ (negative introspection)
3. Evaluate common knowledge: $C P = K E C P$
4. Check epistemic consistency

Fig. 20: Expanded Logic System Processing Architecture Flow (Fuzzy Engine Example)

INPUT: Argument(Fuzzy, Premises, Degrees of Truth, Fuzzy, Conclusion)

PROCESS:

1. Assign truth values in $[0, 1]$
2. T-norm $P \odot Q = \min(P, Q)$
3. T-conorm $P \oplus Q = \max(P, Q)$
4. Aggregate using chosen method (Mamdani, Sugeno)
5. Defuzzification for crisp output

Fig. 21: Expanded Logic System Processing Architecture Flow (Temporal Engine Example)

INPUT: Argument(Temporal, Premises, Time References, Temporal, Conclusion)

PROCESS:

1. Build temporal model $M = (\text{Time}, <, V)$ with linear/branching time
2. Evaluate LTL formulas
 - $O P$ holds in next time point
 - $\Diamond P$ holds at some future time point
 - $\Box P$ holds at all future time points
 - $P U Q$ (P holds until Q becomes true)
3. Model checking against Kripke structure
4. Verify temporal consistency

Fig. 22: Expanded Logic System Processing Architecture Flow (Paraconsistent Engine Example)

INPUT: Argument(Contradictory, Premises, Paraconsistent, Conclusion)

PROCESS:

1. Allow contradictions without explosion $P \wedge \sim P \neq \perp$
2. Use four-valued logic (True, False, Both, Neither)
3. Apply paraconsistent operators
 - Strong negation: $\neg P$ (classical)
 - Weak negation: $\sim P$ (paraconsistent)
4. Resolve conflicts through precedence rules
5. Maintain local consistency

Fig. 23: Expanded Logic System Processing Architecture Flow (Dialectical Engine Example)

INPUT: Argument(Thesis, Antithesis, Synthesis, Direction)

PROCESS:

- 1. Identify dialectical structure $A \rightarrow \neg A \rightarrow B$
- 2. Map contradiction dynamics
- 3. Apply negation of negation: $\neg \neg A$
- 4. Synthesize through Aufhebung (sublation)

Fig. 24: Expanded Logic System Processing Architecture Flow (Meta-Logic Engine Example)

INPUT: Argument(Logic System, References, Meta Statements, Conclusion)

PROCESS:

- 1. Identify object-level vs meta-level statements
- 2. Check consistency across logic systems
- 3. Apply translation functions between priority rules
- 4. Resolve semantic conflicts through framework
- 5. Generate system-transcendent insights

Fig. 25: Extensible Cross-System Translation Matrix Examples

From-To	Translation Function
Boolean - Modal	$P \supset Q$ / partition into necessary/possible
Modal - Temporal	$\Box P \equiv G P$ (globally P)
Deontic - Modal	$O(P) \equiv \Box (\text{ideal} \rightarrow P)$
Epistemic - Probabilistic	$K(P) \equiv P(P) = 1$
Fuzzy - Paraconsistent	$\mu(P) [0,1] \rightarrow \text{weak negation } \sim P$
HoTT - Type Theory	$A \simeq B \equiv (A = B)$
Coalgebraic - Modal	$\nabla P \vdash \Diamond P$
Separation - Linear	$P * Q \equiv P \otimes Q$
ASP - Classical	$\text{:- not } P \rightarrow \text{NAF}(P)$
Category - HOL	$F \dashv G \equiv \text{adjunction}$

[Expanded with 50+ from PDF translations, e.g., Universal: BOOLEAN
 - MODAL $P \supset Q$ / necessary, DEONTIC - MODAL $O(P) = \Box$ (ideal →
 P), etc.]

Fig. 26: Adaptive Processing Workflow (General)

1. Enhanced Input Analysis Phase
 - Tokenize into logical components using extended Unicode dictionary
 - Identify primary + secondary logic systems (multi-framework support)
 - Parse operators using 300+ Unicode symbol mappings
 - Build hybrid abstract syntax tree (AST) supporting multiple systems
 - Validate syntactic well-formedness across all detected frameworks
 - Flag potential translation points between systems
2. Multi-System Logic Engine Selection SWITCH logic_system: CASE Boolean: BooleanEngine.process(argument) CASE Modal: ModalEngine.process(argument) CASE Deontic: DeonticEngine.process(argument) CASE Epistemic: EpistemicEngine.process(argument) CASE Fuzzy: FuzzyEngine.process(argument) CASE Temporal: TemporalEngine.process(argument) CASE Paraconsistent: ParaconsistentEngine.process(argument) CASE Dialectical: DialecticalEngine.process(argument) CASE Meta: MetaEngine.process(argument) CASE HoTT: HoTTEngine.process(argument) CASE Coalgebraic: CoalgebraicEngine.process(argument) CASE Cubical: CubicalEngine.process(argument) CASE Dependent: DependentTypeEngine.process(argument) CASE Separation: SeparationEngine.process(argument) CASE ASP: ASPEngine.process(argument) CASE Quantum: QuantumEngine.process(argument) DEFAULT: UniversalTranslationEngine.process(argument)
3. Cross-System Validation FOR each pair (ArgumentA, ArgumentB):
 - Translate both to common logical language
 - Check for direct contradictions
 - Identify complementary insights
 - Flag irreconcilable differences
 - Generate synthesis opportunities
4. Response Generation OUTPUT { logical_structure: AST, validity_assessment: VALID/INVALID/INDETERMINATE, formal_notation: Unicode logical expression, cross_references: [other_logic_systems], confidence_level: [0.0,1.0] }

```

Fig. 29: Performance Specifications List

- Parsing Speed: <50ms for arguments up to 2000 tokens with 300+ operators
- Logic Processing: <15ms for complex higher-type/categorical reasoning

- Translation: <20ms between any two of 15+ systems
- Multi-System Validation: <35ms for cross-checking all active frameworks
- Memory Usage: <5MB per concurrent process (optimized data structures)
- Plugin Loading: <100ms for runtime system additions
- Accuracy: >95% logical validation within each framework
- Cross-System Coherence: >90% consistency in translation validations
